

Two-field closure: two admissible reductions

Logistic growth is conditional; a moving decorrelation front follows a distinct similarity law.

EXACT TWO-FIELD BALANCE

Truth-forecast interaction supplies full-field error variance. Conservative error self-interaction supplies no net source.

reduction requires structure

INVARIANT-RAY REDUCTION

Logistic amplitude law
one shape • one clock
residual control • coefficient matching

MOVING-FRONT REDUCTION

Spectrum-dependent power law
 $p = (\beta + 1 - n)/(1 - n)$
front propagation replaces
one-shape evolution

FINITE-BAND WARNING

Band edges, forcing, dissipation, leakage, and unresolved transfer enter the residual. A scalar reduction requires that residual to be measured and controlled.

Conceptual map • conditional statements, not an empirical fit
